Ontario Science Centre|
2016,2017

**RECREATIONAL PROGRAMS
VOLUNTEER**

- Aided superordinates in facilitation of scheduled programs
- Helped entertain and ensure safety of campers

PROJECTS

APSC100 Mod 3

My team and I developed system that detects humidity, temperature, and soil moisture levels for exotic ecosystems. Custom PCB and external casing was designed using CAD and case was 3D printed. The website used Bootstrap, HTML, and JS and backend of PHP. Other details included login and user validation, and live data display.

APSC200

Child detector made using FSR, temperature, and PIR sensors, and Arduino UNO to detect temperature and the variables that corresponded to a presence of a child (weight and movement). This was programmed with Arduino C and assembled over a course of a few weeks. The data is continuously streamed into the server, and if there is a trigger for any "dangerous" conditions, then it will ring the buzzer.
